Round 3 agents of `thisjonghoon`: two loops aimed at the grade, models propose, code decides

Blue: a model decides (haiku; manager sonnet; reviewer GPT). Grey: code decides. Green: context we keep. Orange: tools. Dashed: runs inside kit v4. Purple: the supervisor, who only advises and stops bad choices. Orange box: the outer loop.

How it differs from the kit. Two loops aim at the grade itself (shop ALL + buyer ALL, percentiles by the midterm's weights). The *inner loop* moves numbers every 15 minutes: four haiku specialists each read only their own evidence and propose; a GPT reviewer reads the proposals skeptically; a sonnet manager approves, trims or rejects; code bounds each number and steps it once a cycle, and an A/B test inside the shop tries one number, or a whole retail playbook (Costco, Walmart, IKEA, grocery markdown, premium, two-track), on live buyers at the same hours. The *outer loop* changes what no number can: every 90 minutes an engineer agent reads the code, the raw traces and the ledger of past changes and writes one hypothesis aimed at the term that costs the most points, with the metric it should move; a coder agent builds it with a test in a copy; a code gate (allowed files, no payment or key lines, every suite) puts it live; the change runs on half the buyer's orders, and an hour later code compares that metric between the two halves (same hours) and keeps or reverts it, and the expected and measured result goes to the ledger both loops read. Both the shop and the buyer run as ranked teams (60/25/15% of talks, promoted by reward per talk); the seller follows the market (its ask stops at the 75th percentile of what the SKU settled for, never under cost + margin); the buyer's scouts quote several shops at once and it closes an ask within a few percent of its offer. A supervisor watches both loops for the user, reads each automatic change, and steers only through notes. Evidence moved each step: grade C breaks 17.9%; 422 of 680 lost orders were other shops' stock-outs (second scout wave: closed orders 39% → 62%); 92% of food talks opened above the market and closed 37% against 65%; an A/B of 0.92 vs 0.90 ran 4,193 talks with no winner and blocked every other test.
