Round 3 agents of `thisjonghoon`: two loops aimed at the grade, models propose, code decides, memory is re-checked

Blue: a model decides (haiku; manager and lessons sonnet; reviewer GPT, opus while GPT is out). Grey: code decides. Green: context and memory we keep. Orange: tools. Dashed: runs inside kit v4. Purple: the supervisor, who only advises and stops bad choices. Orange box: the outer loop.

How it differs from the kit. Two loops aim at one number, board points per hour by the board's weights. The *inner loop* (every 15 min): haiku specialists read their evidence and lessons, a reviewer on another model checks them, a sonnet manager decides, and code bounds the numbers, runs shop changes one at a time and judges each after 2 h on shop points net of the market (MIXED if another change fell in its hours). The *outer loop* (every 90 min): an engineer and a coder agent change the code in a copy, a gate puts it live, and it is judged on half the orders or net of the market. *Memory is re-checked, not only kept* (after Anthropic's study of agent memory, 2026): past verdicts are judged again from the market's record or marked UNVERIFIED, lessons may cite only known facts, standing orders carry their source. A supervisor watches for the user and changes a number only through the same ledger.
